

A Hunger for the How: Accelerating Interoperability for Food Security Through a Community of Practice

Organization: Civil Society

Data Type: Official statistics, Survey data, Private sector data, Geospatial data, Administrative data, Artificial Intelligence, Monitoring and evaluation, Data for SDG monitoring, Cross cutting

Region: Global

Timeline: Launch in November 2024 around WDF for a period of one year to trial feasibility

Contact Person: Beverley Hatcher-Mbu

bmbu@developmentgateway.org

Sponsoring Organization:

Development Gateway: An IREX Venture

Supporting Organization(s):

TBC

Objective:

To create a global sandbox for interoperability practice, gathering organizations developing products and tools to strengthen agriculture data systems in low- and middle-income countries (LMICs). This community of practice will create a more coherent and efficient approach to agriculture data technical assistance and research, which can generate further use cases that can be applied to other sectors (and other SDGs) globally.

Description:

Despite commitments in several global initiatives to advance interoperability, data and system interoperability has stalled, or is moving too slowly to keep up with emerging global digital needs. However, there is much fragmented knowledge of what has worked, and what hasn't, to support interoperability initiatives among organizations building better integrated data systems, for example in agriculture.

With the rise of AI tools to tackle food insecurity and drive agriculture productivity, practical sharing of lessons and opportunities is essential, as a foundational piece, and accelerator, of digital transformation.

By fostering a more coordinated approach, a cross section of the digital community (statisticians, economists, technologists, and sector experts) can increase impact by streamlining resources, improving tools, and exchanging feedback on new methods of capacity building. Robust exchange can also advance understanding of the risks and opportunities that automation, machine learning and algorithmic models can have within

interoperable architectures.

Activities:

- ? A new Interoperability Community of Practice led by DG and a consortium of partners, building from and channeling existing groups working on standards, digital public goods, and digital public infrastructure in the agriculture space
- ? Link to relevant existing groups. Insights and implementation knowledge that can support the Collaborative for Administrative Data (CAD) Task Team 3 on Data Linking. The Rome Data Champions Group. Feed insights into both groups. Feeding in information, briefs etc.
- ? Knowledge sharing and dissemination of emerging good practices around interoperability practices within agriculture food chains/food security
- ? Peer review and support for documentation of case studies (papers, briefs, blog posts) around successes and failures to implement Interoperability-friendly structures within data ecosystems.

Progress will be monitored through regular meetings of the collaborative partners, annual evaluations (virtual retrospective meeting) of activities and outcomes, and feedback mechanisms from members. Metrics such as the number of partners involved, the frequency of knowledge sharing activities, and any new collaborations or partnerships that resulted from such activities will be used to assess progress.
